

Early - GL1800 Goldwing Instructions

Please read and ensure you fully understand the main lift instructions before commencing, if in any doubt please contact us for advice!

Place the mounts on the lifting arm using the measurements as shown then firmly lock in place using a 13mm wrench.

Next with the motorcycle on its side-stand push the lift into and under the bike from the opposite side ensuring the Rear Mount does not damage the Plastic engine coolant container situated adjacent to the mounting point.

Important.

Ensure that the Main Lifting arm is completely inline with the centre line of the bike/tyres, Failure to do this could be dangerous!

Now check that the Front Mount is sitting correctly with the cut out clearing the centre ridge of the Crankcase, then when satisfied manually start turning the screw-shaft clockwise using a 22mm socket until the mounts make contact with the bike.

At this point assist the bike to the vertical position continuing turning the screw-shaft until full contact is made.

Now do a final check that the mounts are in the correct position and when satisfied the bike can be fully raised.

Always use tie down ratchet straps or similar for maximum Safety and Stability!!
