

# CanAm RYKER Instruction 2019

Prepare and position the bike ready for lifting, always working from the Right Hand Side of the machine.

Lift up the RH side footpeg and slide it back along the frame to make room for the pillar of the Big Blue leaving enough gap for location of the rear mount.

Position the Front and Rear mounts precisely on to the lift as shown in Pic 1. Ensure the vertical section of the mounts are positioned square 90deg to the ends of the Blue lift beam and lock them into position by tightening the M8 nuts with a 13mm wrench, then fully lower the lift.

Note: The front mount is height adjustable so a good starting point is the 3<sup>rd</sup> highest position but this can altered to change the attitude of the bike to suit your needs

Carefully slide the lift under the machine avoiding contact with engine or exhaust and by moving the lift position the RH side frame rail at point “A” central on the rubber pad of the rear mount ensuring that this is mirrored at the LH side of the bike adjusting it if required. Point “B”.

The front mount should now be in the correct position of the front A Frame rails, It is important to keep this point central, Then finally, Be Sure to Double Check that all Lifting Points are correctly positioned, If so the bike is now ready for lifting!
